

# Gold reserves, military, population, interest rate, inflation rate and fakeness of central bank: Odd one out

Soumadeep Ghosh

Kolkata, India

## Abstract

In this paper, I describe how Turkey is the odd one out when it comes to gold reserves, military, population, interest rate, inflation rate and the fakeness of central bank.  
The paper ends with "The End"

## Introduction

In this paper, using data from Trading Economics, Wikipedia and Google Trends, I describe how Turkey is the odd one out when it comes to gold reserves, military, population, interest rate, inflation rate and the fakeness of central bank.

## Methodology

We use the features **gold reserves**, **military**, **population**, the **interest rate**, the **inflation rate** and the **fakeness of central bank** to **cluster** top 15 nation-states with the highest gold reserves into 2 clusters.

## Data sources

1. Gold reseerves
2. Military
3. Population
4. Interest rate
5. Inflation rate
6. Google Trends

## Mathematica code

Mathematica code for the clustering is available [here](#).

## Output

The output shows **Turkey** as the only member in its cluster and **all remaining nations** in the second cluster.

## Conclusion

We **conclude** that the dynamics of gold reserves, military, population, the interest rate, the inflation rate and the fakeness of central bank in Turkey is **different** from most of the top gold-reserving nations in the world.

## The End
